

Uses

Global consumption of natural gas

Source: BP Statistical Review (2018)

Description:

These graphs represent the global evolution of the natural gas consumption by zone and worldwide over the years.

Analysis:

Gas is the third most important source of energy, just after oil and coal. Apart from a decrease during the 2008-2009 crisis, world global consumption of natural gas is increasing over the years, and it reached 3,670.4 Gm³ in 2017.

World global consumption of natural gas is driven by the demand in America and in Asia, due to a strong economic and demographic growth combined with low gas prices. EU represents 12% of world's global consumption of natural gas.
